DATASHEET

FN6249 Rev X.00 Oct 10, 2011

The ISL59534 is a 300MHz 32x16 Video Crosspoint Switch. Each input has an integrated DC-restore clamp and an input buffer. Each output has a fast On-Screen Display (OSD) switch (for inserting graphics or other video) and an output buffer. The switch is non-blocking, so any combination of inputs to outputs can be chosen, including one channel driving multiple outputs. The Broadcast Mode directs one input to all 16 outputs. The output buffers can be individually controlled through the SPI interface, the gain can be programmed to +1 or +2, and each output can be placed into a high impedance mode.

The ISL59534 offers a typical -3dB signal bandwidth of 300MHz. Differential gain of 0.025% and differential gain of 0.05°, along with 0.1dB flatness out to 50MHz, make the ISL59534 suitable for many video applications.

The switch matrix configuration and output buffer gain are programmed through an SPI/QSPI™-compatible three-wire serial interface. The ISL59534 interface is designed to facilitate both fast updates and initialization. On power-up, all outputs are high impedance to avoid output conflicts.

The ISL59534 is available in a 356 ball HBGA package and specified over an extended -40°C to +85°C temperature range.

The single-supply ISL59534 can accommodate input signals from 0V to 3.5V and output voltages from 0V to 3.8V. Each input includes a clamp circuit that restores the input level to an externally applied reference in AC-coupled applications.

The ISL59535 is a fully differential input version of this device.

### **Features**

- 32x16 non-blocking switch with buffered inputs and outputs
- · 300MHz typical bandwidth
- 0.025%/0.05° dG/dP
- · Output gain switchable x1 or x2 for each channel
- · Individual outputs can be put in a high impedance state
- · -90dB Isolation at 6MHz
- · SPI digital interface
- · Single +5V supply operation
- · Pb-free (RoHS compliant)

### **Applications**

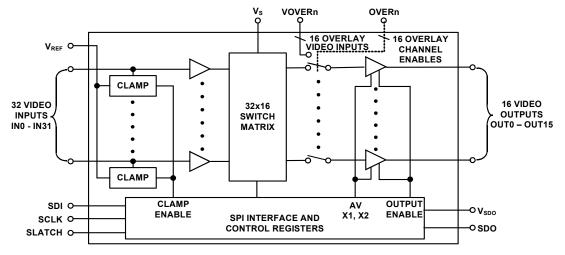

- · Security camera switching
- · RGB routing
- · HDTV routing

## **Ordering Information**

| PART NUMBER  | PART         | PACKAGE     | PKG.        |
|--------------|--------------|-------------|-------------|
| (Note)       | MARKING      | (Pb-Free)   | DWG. #      |
| ISL59534IKEZ | ISL59534IKEZ | 356 Ld HBGA | V356.27x27C |

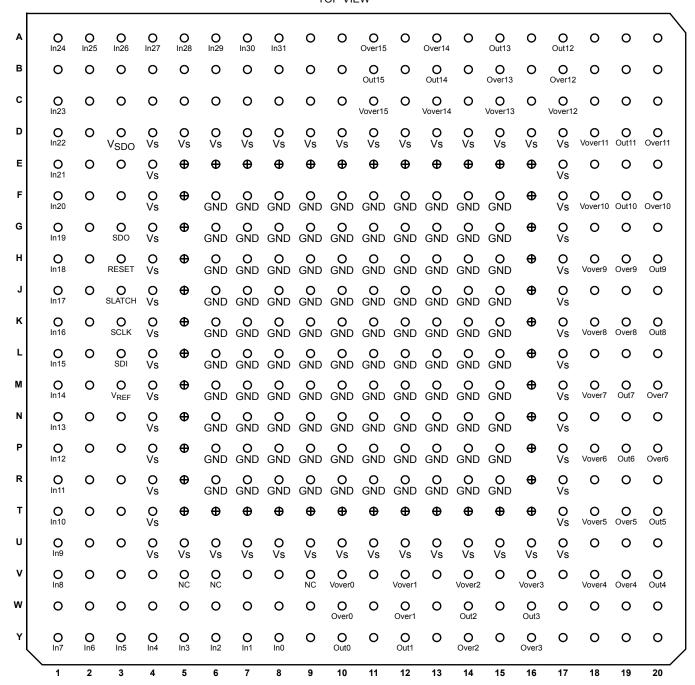

NOTE: These Intersil Pb-free WLCSP and BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAgCu - e1 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free WLCSP and BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## Block Diagram

### **Pinout**

# 

 Machine Model
 100V

 Ambient Operating Temperature
 -40°C to +85°C

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

#### NOTES:

- 1. θ<sub>JA</sub> is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- 2. For  $\theta_{\mbox{\scriptsize JC}},$  the "case temp" location is taken at the package top center.

### **DC Electrical Specifications** $V_S$ = 5V, $R_L$ = 150 $\Omega$ unless otherwise noted.

| VOVER15          | C11    | Overlay Video Input   |
| VREF             | M3     | DC-restore clamp reference input. In an AC-coupled configuration (DC-Restore clamp enabled), the sync tip of composite video inputs will be restored to this level. Set to 0.3 to 0.7V for optimum performance.  In an DC-coupled configuration (DC-Restore clamp disabled), this pin should be tied to ground.  Do not let the V <sub>REF</sub> pin float! A floating V <sub>REF</sub> pin drifts high and, if the clamp function is enabled, will cause all of the outputs to simultaneously try to drive ~4V DC into their 150Ω loads. |
| SLATCH           | J3     | Serial Latch. Serial data is latched into ISL59534 on rising edge of SLATCH.  |
| SCLK             | K3     | Serial data clock   |
| SDI              | L3     | Serial data input   |
| SDO              | G3     | Serial data output. Can be tied to SDI of another ISL59534 to enable daisy-chaining of multiple devices.  |
| RESET            | Н3     | Reset input. Pull high then low to reset device, but not needed in normal operation. Tie to ground in final application.  |
| V <sub>SDO</sub> | D3     | Power supply for SDO pin. Tie to +5V for a 0 to 5V SDO output signal swing.   |
| V <sub>S</sub>   |        | +5V power supply  |

### **Block Diagram**

### General Description

The ISL59534 is a 32x16 integrated video crosspoint switch matrix with input and output buffers and On-Screen Display (OSD) insertion. This device operates from a single +5V supply. Any output can be generated from any of the 32 input video signal sources, and each output can have OSD information inserted through a dedicated, fast 2:1 mux located before the output buffer. There is also a Broadcast mode allowing any one input to be broadcast to all 16 outputs. A DC restore clamp function enables the ISL59534 to AC-couple incoming video.

The ISL59534 offers a -3dB signal bandwidth of 300MHz. Differential gain and differential phase of 0.025% and 0.05° respectively, along with 0.1dB flatness out to 50MHz make this ideal for multiplexing composite NTSC and PAL signals. The switch matrix configuration and output buffer gain are programmed through an SPI/QSPI™-compatible, three-wire serial interface. The ISL59534 interface is designed to facilitate both fast initialization and configuration changes. On powerup, all outputs are initialized to the disabled state to avoid output conflicts in the user's system.

#### Digital Interface

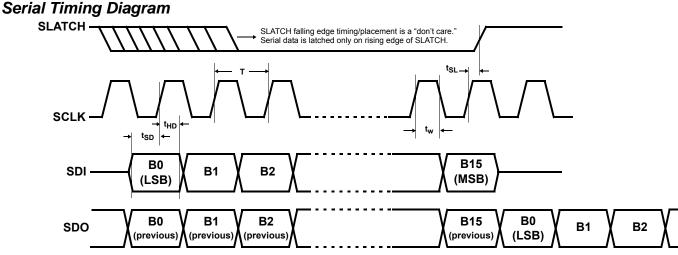

The ISL59534 uses a serial interface to program the configuration registers. The serial interface uses three signals (SCLK, SDI, and SLATCH) for programming the ISL59534, while a fourth signal (SDO) enables optional daisy-chaining of multiple devices. The serial clock can run at up to 5MHz (5Mbits/s).

#### Serial Interface

The ISL59534 is programmed through a simple serial interface. Data on the SDI (serial data input) pin is shifted into a 16-bit shift register on the rising edge of the SCLK (serial clock) signal. (This is continuously done regardless of the state of the SLATCH signal.) The LSB (bit 0) is loaded first and the MSB (bit 15) is loaded last (see the Serial Timing Diagram). After all 16 bits of data have been loaded into the shift register, the rising edge of SLATCH updates the internal registers.

While the ISL59534 has an SDO (Serial Data Out) pin, it does not have a register readback feature. The data on the SDO pin is an exact replica of the incoming data on the SDI pin, delayed by 15.5 SCLKs (an input bit is latched on the rising edge of SLCK, and is output on SDO on the falling edge of SLCK 15.5 SCLKs later). Multiple ISL59534's can be daisy-chained by connecting the SDO of one to the SDI of the other, with SCLK and SLATCH common to all the daisy-chained parts. After all the serial data is transmitted (16 bits \* n devices = 16\*n SCLKs), the rising edge of SLATCH will update the configuration registers of all n devices simultaneously.

The Serial Timing Diagram and Serial Timing Parameters table on page 17 show the timing requirements for the serial interface.

SDO = SDI delayed by 15.5 SCLKs to allow daisy-chaining of multiple ISL59534s. SDO changes on the falling edge of SCLK.

**TABLE 1. SERIAL TIMING PARAMETERS** 

| PARAMETER       | RECOMMENDED OPERATING RANGE | DESCRIPTION   |
|-----------------|-----------------------------|---|
| Т               | ≥200ns                      | SCLK period   |
| t <sub>W</sub>  | 0.50 * T                    | Clock Pulse Width   |
| t <sub>SD</sub> | ≥20ns                       | Data Setup Time   |
| t <sub>HD</sub> | ≥20ns                       | Data Hold Time  |
| t <sub>SL</sub> | ≥20ns                       | Final SLCK rising edge (latching B15) to SLATCH rising edge |

### **Programming Model**

The ISL59534 is configured by a series of 16-bit serial control words. The three MSBs (B15-13) of each serial word determine the basic command:

**TABLE 2. COMMAND FORMAT** 

| B15 | B14 | B13 | COMMAND  | NUMBER OF WRITES         |
|-----|-----|-----|--|--------------------------|
| 0   | 0   | 0   | INPUT/OUTPUT: Maps input channels to output channels   | 32 (1 channel per write) |
| 0   | 0   | 1   | OUTPUT ENABLE: Output enable for individual channels   | 4 (4 channels per write) |
| 0   | 1   | 0   | GAIN SET: Gain (+1 or +2) for each channel   | 4 (4 channels per write) |
| 0   | 1   | 1   | BROADCAST: Enables broadcast mode and selects the input channel to be broadcast to all output channels | 1                        |
| 1   | 1   | 1   | CONTROL: Clamp on/off, operational/standby mode, and global output enable/disable                      | 1                        |

#### **Mapping Inputs to Outputs**

Inputs are mapped to their desired outputs using the input/output control word. Its format is:

**TABLE 3. INPUT/OUTPUT WORD** 

| B15 | B14 | B13 | B12 | B11            | B10            | В9             | B8             | В7 | В6 | B5 | B4 | В3 | B2 | B1             | В0 |
|-----|-----|-----|-----|----------------|----------------|----------------|----------------|----|----|----|----|----|----|----------------|----|
| 0   | 0   | 0   | 14  | l <sub>3</sub> | l <sub>2</sub> | I <sub>1</sub> | I <sub>0</sub> | -  | -  | -  | Ο3 | 02 | 01 | O <sub>0</sub> |    |

 $I_4:I_0$  form the 5-bit word indicating the input channel (0 to 31), and  $O_3:O_0$  determine the output channel which that input channel will map to. One input can be mapped to one or multiple outputs. To fully program the ISL59534, 32 INPUT/OUTPUT words must be transmitted - one for each input channel.

Note: Broadcast Mode must be disabled when configuring input/output mapping. INPUT/OUTPUT words transmitted while in Broadcast Mode will not be processed correctly and result in corrupt channel mapping when Broadcast Mode is disabled.

#### **Enabling Outputs**

The output enable control word is used to enable individual outputs. There are 16 channels to configure, so this is accomplished by writing 4 serial words, each controlling a bank of eight outputs at a time. The bank is selected by bits B9 and B8. The output enable control word format is:

**TABLE 4. OUTPUT ENABLE FORMAT** 

| B15 | B14 | B13 | B12 | B11 | B10 | В9 | В8 | В7 | В6              | B5 | B4              | В3 | B2              | B1 | В0              |
|-----|-----|-----|-----|-----|-----|----|----|----|-----------------|----|-----------------|----|-----------------|----|-----------------|
| 0   | 0   | 1   | 0   | 0   | 0   | 0  | 0  |    | Ο3              |    | 02              |    | 01              |    | Ο <sub>0</sub>  |
| 0   | 0   | 1   | 0   | 0   | 0   | 0  | 1  |    | 07              |    | 06              |    | 05              |    | 04              |
| 0   | 0   | 1   | 0   | 0   | 0   | 1  | 0  |    | O <sub>11</sub> |    | O <sub>10</sub> |    | O <sub>9</sub>  |    | Ο <sub>8</sub>  |
| 0   | 0   | 1   | 0   | 0   | 0   | 1  | 1  |    | O <sub>15</sub> |    | O <sub>14</sub> |    | O <sub>13</sub> |    | O <sub>12</sub> |

Setting the  $O_N$  bit = 0 tri-states the output. Setting the  $O_N$  bit = 1 enables the output if the Global Output Enable bit is also set (the individual output enable bits are ANDed with the Global Output Enable bit before they are sent to the output stage).

#### **Setting the Gain**

The gain of each output may be set to +1 or +2 using the Gain Set word. It is in the same format as the output enable control word:

**TABLE 5. GAIN SET FORMAT** 

| B15 | B14 | B13 | B12 | B11 | B10 | В9 | В8 | B7 | В6              | B5 | B4              | В3 | B2              | B1 | В0              |
|-----|-----|-----|-----|-----|-----|----|----|----|-----------------|----|-----------------|----|-----------------|----|-----------------|
| 0   | 1   | 0   | 0   | 0   | 0   | 0  | 0  |    | G <sub>3</sub>  |    | G <sub>2</sub>  |    | G <sub>1</sub>  |    | G <sub>0</sub>  |
| 0   | 1   | 0   | 0   | 0   | 0   | 0  | 1  |    | G <sub>7</sub>  |    | G <sub>6</sub>  |    | G <sub>5</sub>  |    | G <sub>4</sub>  |
| 0   | 1   | 0   | 0   | 0   | 0   | 1  | 0  |    | G <sub>11</sub> |    | G <sub>10</sub> |    | G <sub>9</sub>  |    | G <sub>8</sub>  |
| 0   | 1   | 0   | 0   | 0   | 0   | 1  | 1  |    | G <sub>15</sub> |    | G <sub>14</sub> |    | G <sub>13</sub> |    | G <sub>12</sub> |

Set  $G_N = 0$  for a gain of +1 or 1 for a gain of +2.

#### **Broadcast Mode**

The Broadcast Mode routes one input to all 16 outputs. The broadcast control word is:

### **TABLE 6. BROADCAST FORMAT**

| B15 | B14 | B13 | B12            | B11            | B10            | В9             | B8             | B7 | В6 | B5 | B4 | В3 | B2 | B1 | В0  |
|-----|-----|-----|----------------|----------------|----------------|----------------|----------------|----|----|----|----|----|----|----|---|
| 0   | 1   | 1   | I <sub>4</sub> | l <sub>3</sub> | l <sub>2</sub> | I <sub>1</sub> | I <sub>0</sub> | 0  | 0  | 0  | 0  | 0  | 0  | 0  | Enable Broadcast 0: Broadcast Mode Disabled 1: Broadcast Mode Enabled |

 $I_4:I_0$  form the 5 bit word indicating the input channel (0 to 31) to be sent to all 16 outputs. Set the Enable Broadcast bit (B0) = 1 to enable Broadcast Mode, or to 0 to disable Broadcast Mode. When Broadcast Mode is disabled, the previous channel assignments are restored.

### **Control Word**

The ISL59534's power-on reset disables all outputs and places the part in a low-power standby mode. To enable the device, the following control word should be sent:

**TABLE 7. CONTROL WORD FORMAT** 

| B15 | B14 | B13 | B12 | B11 | B10 | В9                | В8 | В7 | В6 | В5 | B4 | В3 | B2 | B1             | В0   |
|-----|-----|-----|-----|-----|-----|-------------------|----|----|----|----|----|----|----|----------------|--|
| 1   | 1   | 1   | 0   | 0   | 0   | Clamp             | 0  | 0  | 0  | 0  | 0  | 0  | 0  | Power          | Global Output Enable                             |
|     |     |     |     |     |     | 0: Clamp Disabled |    |    |    |    |    |    |    | 0: Standby     | 0: All outputs tri-stated                        |
|     |     |     |     |     |     | 1: Clamp Enabled  |    |    |    |    |    |    |    | 1: Operational | 1: Individual Output Enable bits control outputs |

The Clamp bit enables the input clamp function, forcing the AC-coupled signal's most negative point to be equal to V<sub>RFF</sub>.

**Note:** The Clamp bit turns the DC-Restore clamp function on or off for *all* channels - there is no DC-Restore on/off control for individual channels. The DC-Restore function only works with signals with sync tips (composite video). Signals that do not

have sync tips (the Chroma/C signal in s-video and the Pb, Pr signals in Component video), will be severely distorted if run through a DC-Restore/clamp function.

For this reason, the ISL59534 must be in DC-coupled mode (Clamp Disabled) to be compatible with s-video and component video signals.

#### **Bandwidth Considerations**

Wide frequency response (high bandwidth) in a video system means better video resolution. Four sets of frequency response curves are shown in Figure 47. Depending on the switch configurations, and the routing (the path from the input to the output), bandwidth can vary between 100MHz and 350MHz. A short discussion of the trade-offs — including matrix configuration, output buffer gain selection, channel selection, and loading — follows.

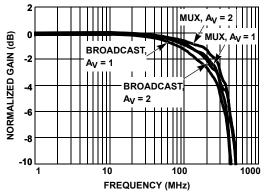

FIGURE 47. FREQUENCY RESPONSE FOR VARIOUS MODES

In multiplexer mode, one input typically drives one output channel, while in broadcast mode, one input drives all 16 outputs. As the number of outputs driven increases, the parasitic loading on that input increases. Broadcast Mode is the worst-case, where the capacitance of all 16 channels loads one input, reducing the overall bandwidth. In addition, due to internal device compensation, an output buffer gain of +2 has higher bandwidth than a gain of +1. Therefore, the highest bandwidth configuration is multiplexer mode (with each input mapped to only one output) and an output buffer gain of +2.

The relative locations of the input and output channels also have significant impact on the device bandwidth (due to the layout of the ISL59534 silicon). When the input and output channels are further away, there are additional parasitics as a result of the additional routing, resulting in lower bandwidth.

The bandwidth does not change significantly with resistive loading as shown in the typical performance curves. However several of the curves demonstrate that frequency response is sensitive to capacitance loading. This is most significant when laying out the PCB. If the PCB trace length between the output of the crosspoint switch and the back-termination resistor is not minimized, the additional parasitic capacitance will result in some peaking and eventually a reduction in overall bandwidth.

#### **Linear Operating Region**

In addition to bandwidth optimization, to get the best linearity the ISL59534 should be configured to operate in its most linear operating region. Figure 48 shows the differential gain curve. The ISL59534 is a single supply 5V design with its most linear region between 0.1 and 2V. This range is fine for most video signals whose nominal signal amplitude is 1V. The most negative input level (the sync tip for composite video) should be maintained at 0.3V or above for best operation.

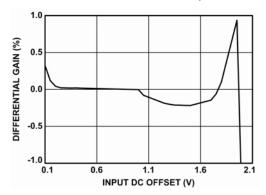

FIGURE 48. DIFFERENTIAL GAIN RESPONSE

In a DC-coupled application, it is the system designer's responsibility to ensure that the video signal is always in the optimum range.

When AC coupling, the ISL59534's Clamp (also called "DC restore") function automatically and continuously adjusts the DC level so that the most negative portion of the video is always equal to  $V_{\mbox{\scriptsize REF}}$ .

A discussion of the benefits of the DC restoration function begins by understanding the Clamp circuit shown in Figure 49. The incoming video signal is typically terminated into  $75\Omega$ , then AC coupled through  $C_1$ , at which point it is connected to the base of the buffer's diff pair. These components form the video path.

The Clamp function consists of  $Q_1$ ,  $D_1$ ,  $Q_2$ ,  $D_2$ , the two current sources, and the 3 switches controlled by the Clamp Enable signal. The  $V_{REF}$  voltage is level-shifted up two diode drops  $(Q_1$  and  $D_1)$  to the base of  $Q_2$ . If the voltage at the cathode of  $D_2$  goes below  $V_{REF}$ ,  $Q_2$  and  $D_2$  will turn on, keeping the  $IN_X$  voltage at  $V_{REF}$ . If the voltage at  $IN_X$  is greater than  $V_{REF}$ ,  $Q_2$  and  $D_2$  are off and the  $IN_X$  node is high impedance. This is how the clamp function forces the lowest portion of the video signal (the sync tip) to always be equal to or greater than  $V_{REF}$ .

To make sure that the sync tip is always equal to (not equal to or greater than)  $V_{REF}$ ,  $i_1$  is constantly sinking  $\sim 2\mu A$  of current from  $C_1$ . This causes each sync tip to be slightly lower voltage than the previous sync tip, causing  $Q_2$  and  $D_2$  to turn on at each sync tip and raise the voltage to  $V_{REF}$ . The  $2\mu A$  pulldown with a 0.1uF capacitor and a 15kHz HSYNC frequency results in 1.3mV of "droop" across every line, or 0.2% of the video

signal. Because 1.3mV is only 0.2% of a 0.7V video signal, this droop is imperceptible to the human eye.

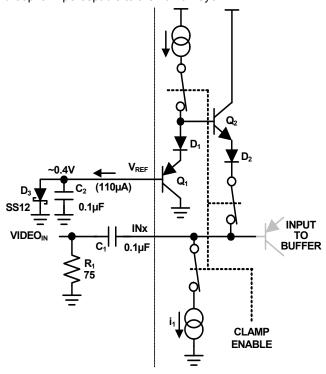

FIGURE 49. DC RESTORE BLOCK DIAGRAM

This is how the video is "DC-restored" after being AC coupled into the ISL59534. The sync tip voltage will be equal to  $V_{REF}$  on the right side of  $C_1$ , regardless of the DC level of the video on the left side of  $C_1$ . Due to various sources of offset in the actual clamp function, the actual sync tip level is typically about 75mV higher than  $V_{REF}$  (for  $V_{REF}$  = 0.4V).

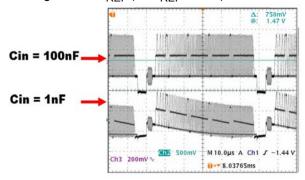

FIGURE 50. DC RESTORE VIDEO WAVEFORMS

It is important to choose the correct value for  $C_{IN}.$  Too small a value will generate too much droop, and the image will be visibly darker on the right than on the left. A  $C_{IN}$  value that is too large may cause the clamp to fail to converge. The droop rate (dV/dt) is  $i_1/C_{IN}$  volts/second. In general, the droop voltage should be limited to <1 IRE over a period of one line of video; so for 1 IRE = 7mV,  $I_B$  = 10 $\mu$ A maximum, and an NTSC waveform we will set  $C_{IN}$  > 10 $\mu$ A\*60 $\mu$ s/7mV = 0.086 $\mu$ F. Figure 50 shows the result of  $C_{IN}$  = 0.1 $\mu$ F delivering acceptable droop and  $C_{IN}$  = 0.001 $\mu$ F producing excessive droop.

When the clamp function is disabled in the CONTROL register (Clamp = 0) to allow DC-coupled operation, the  $I_{CLAMP}$  current sinks/sources are disabled and the input passes through the DC Restore block unaffected. In this application  $V_{REF}$  may be tied to GND.

### **Overlay Operation**

The ISL59534 features an overlay feature, that allows an external video signal or DC level to be inserted in place of that output channel's video. When the  $\mathsf{OVER}_N$  signal is taken high, the output signal on the  $\mathsf{OUT}_N$  pin is replaced with the signal on the  $\mathsf{VOVER}_N$  pin.

There are several ways the overlay feature can be used. Toggling the  $\mathsf{OVER}_N$  signal at the frame rate or slower will replace the video frame(s) on the  $\mathsf{OUT}_N$  pin with the video supplied on the  $\mathsf{VOVER}_N$  pin.

Another option (for OSD displays, for example), is to put a DC level on the  $VOVER_N$  line and toggle the  $OVER_N$  signal at the pixel rate to create a monocolor image "overlaid" on channel N's output signal.

Finally, by enabling the  $\mathsf{OVER}_N$  signal for some portion of each line over a certain amount of lines, a picture-in-picture function can be constructed.

It's important to note that the overlay inputs do not have the DC Restore function previously described - the overlay signal is DC coupled into the output. It is the system designer's responsibility to ensure that the video levels are in the ISL59534's linear region and matching the output channel's offset and amplitude. One easy way to do this is to run the video to be overlaid through one of the ISL59534's unused channels and then into the VOVER $_{\rm N}$  input.

The  $\mathsf{OVER}_\mathsf{N}$  pins all have weak pull-downs, so if they are unused, they can either be left unconnected or tied to GND.

### Power Dissipation and Thermal Resistance

With a large number of switches, it is possible to exceed the +150°C absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for an application to determine if load conditions or package types need to be modified to assure operation of the crosspoint switch in a safe operating area.

The maximum power dissipation allowed in a package is determined according to:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\Theta_{JA}}$$
(EQ. 1)

Where:

- T<sub>JMAX</sub> = Maximum junction temperature = +125°C
- T<sub>AMAX</sub> = Maximum ambient temperature = +85°C
- θ<sub>JA</sub> = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or:

$$PD_{MAX} = V_S \times I_{SMAX} + \sum_{i=1}^{n} (V_S - V_{OUTi}) \times \frac{V_{OUTi}}{R_{Li}}$$
(EQ. 2)

Where:

- V<sub>S</sub> = Supply voltage = 5V
- I<sub>SMAX</sub> = Maximum quiescent supply current = 505mA
- V<sub>OUT</sub> = Maximum output voltage of the application = 2V
- R<sub>LOAD</sub> = Load resistance tied to ground = 150
- n = 1 to 16 channels

$$PD_{MAX} = V_S \times I_{SMAX} + \sum_{i=1}^{n} (V_S - V_{OUTi}) \times \frac{V_{OUTi}}{R_{Li}} = 3.2W$$
(EQ. 3)

The required  $\theta_{JA}$  to dissipate 3.2W is:

$$\Theta_{JA} = \frac{T_{JMAX} - T_{AMAX}}{PD_{MAX}} = 12.5(°C/W)$$
(EQ. 4)

# **Package Outline Drawing**

#### V356.27x27C

356 BALL HEATSINK PLASTIC BALL GRID ARRAY PACKAGE (HPBGA) Rev 1, 6/10

#### NOTES:

- 1. All dimensions and tolerances conform to ASME Y14.5m-1994.
- 2. Dimensions are in millimeters.
- Dimension is measured at the maximum solder ball diameter, parallel to primary datum C.
- Primary datum C and seating plane are defined by the spherical crowns of the solder balls.
- 5. A1 ball pad corner I.D. for plate mold: To be marked by ink. Auto mold: Dimple to be formed by mold cap.
- Reference specifications: This drawing conforms to JEDEC registered outline MS-034/A variation BAL-2.
