

Ultra Low Quiescent Current Synchronous Step-Down PFM DC/DC Converter for Low Output Voltage

☆GreenOperation compatible

■GENERAL DESCRIPTION

XC9272 series are Ultra Low Quiescent Current synchronous-rectification for Low Output Voltage type PFM step down DC/DC converters with a built-in 0.4Ω (TYP.) Pch driver and 0.4Ω (TYP.) Nch synchronous switching transistor, designed to allow the use of ceramic capacitor.

PFM control enables a low quiescent current, making these products ideal for battery operated devices that require high efficiency and long battery life.

Only inductor, C_{IN} and C_L capacitors are needed as external parts to make a step down DC/DC circuit.

Operation voltage range is from 2.0V to 6.0V. This product has fixed output voltage from 0.6V to 0.95V(accuracy: $\pm 20\text{mV}$) in increments of 0.05V.

During stand-by, all circuits are shutdown to reduce consumption to as low as $0.1\mu\text{A}$ (TYP.) or less.

With the built-in UVLO (Under Voltage Lock Out) function, the internal P-channel MOS driver transistor is forced OFF when input voltage gets lower than UVLO detection voltage. Besides, XC9272 series has UVLO release voltage of 1.8V (Typ.).

The product with C_L discharge function, XC9272B type, can discharge C_L capacitor during stand-by mode due to the internal resistance by turning on the internal switch between V_{OUT} -GND. This enables output voltage restored to GND level fast.

■APPLICATIONS

- Electric devices with GPS
- Wearable devices
- Energy Harvest devices
- Backup power supply circuits
- Devices with 1 Lithium cell

■FEATURES

Input Voltage Range	: 2.0V~6.0V
Output Voltage Setting	: 0.6V~0.95V ($\pm 20\text{mV}$, 0.05V step increments)
Output Current	: 50mA
Driver Transistor	: 0.4Ω (Pch Driver Tr) 0.4Ω (Nch Synchronous rectifier Switch Tr)
Supply Current	: $0.50\mu\text{A}$ @ $V_{OUT(T)}=0.7\text{V}$ (TYP.)
Control Method	: PFM control
High Speed Transient	: 50mV ($V_{IN}=3.6\text{V}$, $V_{OUT}=0.7\text{V}$, $I_{OUT}=10\mu\text{A} \rightarrow 50\text{mA}$)
PFM Switching Current	: 180mA
Function	: Short Protection function C_L Discharge(XC9272B type) UVLO function Ceramic Capacitor Compatible
Operation Ambient Temperature	: $-40 \sim +85^\circ\text{C}$
Package	: SOT-25, USP-6EL
Environmentally Friendly	: EU RoHS compliant, Pb Free

■TYPICAL APPLICATION CIRCUIT

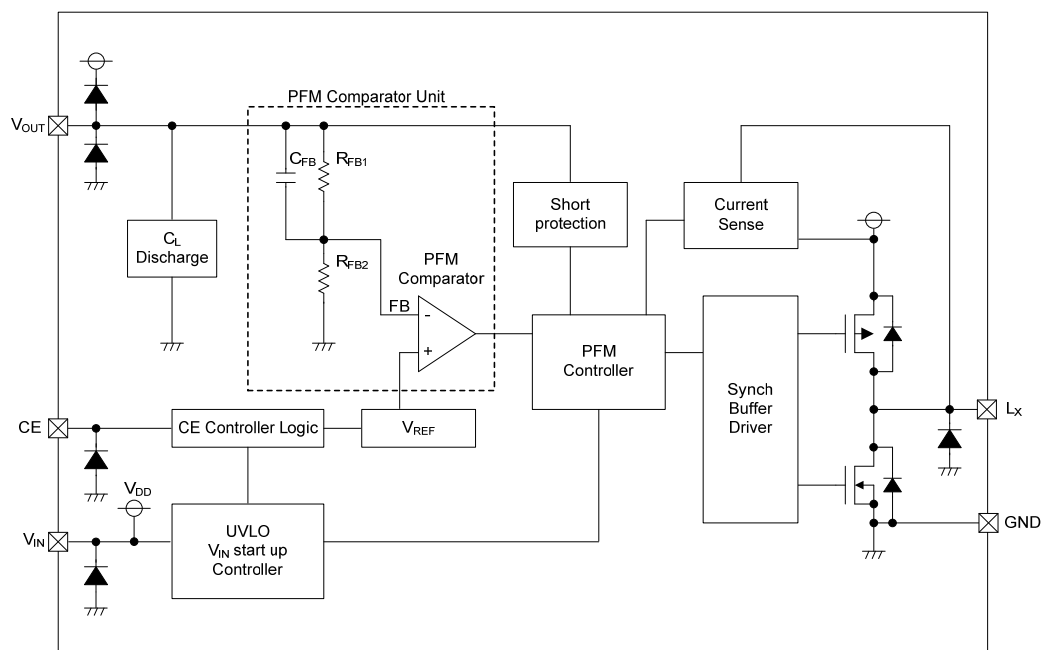

■TYPICAL PERFORMANCE CHARACTERISTICS

●Efficiency vs. Output Current

BLOCK DIAGRAM

* Diodes inside the circuits are ESD protection diodes and parasitic diodes.

XC9272A type does not have C_L Discharge function.

PRODUCT CLASSIFICATION

Ordering information

XC9272①②③④⑤⑥⑦

DESIGNATOR	ITEM	SYMBOL	DESCRIPTION
①	Product Type	A	Without C_L Discharge
		B	With C_L Discharge
②③	Output Voltage	06 ~ 09	Output Voltage : e.g. $V_{OUT}=0.7V \Rightarrow$ ②=0, ③=7 Output Voltage Range: 0.6V~0.95V (0.05V step)
④	Output Voltage Type	1	Output Voltage {x.x0V} (the 2nd decimal place is "0")
		B	Output Voltage {x.x5V} (the 2nd decimal place is "5")
⑤⑥⑦ (*1)	Packages (Order Unit)	4R-G	USP-6EL (3,000pcs/Reel)
		MR-G	SOT-25 (3,000pcs/Reel)

(*1) The "-G" suffix denotes Halogen and Antimony free as well as being fully EU RoHS compliant.

PIN CONFIGURATION

* The dissipation pad for the USP-6EL package should be solder-plated in reference mount pattern and metal masking so as to enhance mounting strength and heat release. The mount pattern should be connected to GND pin (No.2).

PIN ASSIGNMENT

PIN NUMBER		PIN NAME	FUNCTIONS
USP-6EL	SOT-25		
1	5	L _X	Switching

C _L	TAIYO YUDEN	JMK107BJ226MA	22 μ F/6.3V

* Take capacitance loss, withstand voltage, and other conditions into consideration when selecting components.

* Characteristics are dependent on deviations in the coil inductance value. Test fully using the actual device.

* A value of 10 μ H is recommended for the coil inductance.

* If a tantalum or electrolytic capacitor is used for the load capacitance C_L, ripple voltage will increase, and there is a possibility that operation will become unstable. Test fully using the actual device.

■ OPERATIONAL EXPLANATION

The XC9272 series consists of a reference voltage supply, PFM comparator, Pch driver Tr, Nch synchronous rectification switch Tr, current sensing circuit, PFM control circuit, CE control circuit, and others. (Refer to the block diagram below.)

An ultra-low quiescent current circuit and synchronous rectification enable a significant reduction of dissipation in the IC, and the IC operates with high efficiency at both light loads and heavy loads. Current limit PFM is used for the control method, and even when switching current superposition occurs, increases of output voltage ripple are suppressed, allowing use over a wide voltage and current range. The IC is compatible with low-capacitance ceramic capacitors, and a small, high-performance step-down DC-DC converter can be created.

The actual output voltage $V_{OUT(E)}$ in the electrical characteristics is the threshold voltage of the PFM comparator in the block diagram. Therefore the average output voltage of the step-down circuit, including peripheral components, depends on the ripple voltage. Before use, test fully using the actual device

<Reference voltage supply (V_{REF})>

Reference voltage for stabilization of the output voltage of the IC.

<PFM control>

(1) The feedback voltage (FB voltage) is the voltage that results from dividing the output voltage with the IC internal dividing resistors R_{FB1} and R_{FB2} . The PFM comparator compares this FB voltage to V_{REF} . When the FB voltage is lower than V_{REF} , the PFM comparator sends a signal to the buffer driver through the PFM control circuit to turn on the Pch driver Tr. When the FB voltage is higher than V_{REF} , the PFM comparator sends a signal to prevent the Pch driver Tr from turning on.

(2) When the Pch driver Tr is on, the current sense circuit monitors the current that flows through the Pch driver Tr connected to the Lx pin. When the current reaches the set PFM switching current (I_{PFM}), the current sense circuit sends a signal to the buffer driver through the PFM control circuit. This signal turns off the Pch driver Tr and turns on the Nch synchronous rectification switch Tr.

(3) The on time of the Nch synchronous rectification switch Tr is dynamically optimized inside the IC. After the off time elapses and the PFM comparator detects that the V_{OUT} voltage is higher than the set voltage, the PFM comparator sends a signal to the PFM control circuit that prevents the Pch driver Tr from turning on. However, if the V_{OUT} voltage is lower than the set voltage, the PFM comparator starts Pch driver Tr on.

By continuously adjusting the interval of the linked operation of (1), (2) and (3) above in response to the load current, the output voltage is stabilized with high efficiency from light loads to heavy loads.

■ OPERATIONAL EXPLANATION (Continued)

<PFM Switching Current >

The PFM switching current monitors the current that flows through the Pch driver Tr, and is a value that limits the Pch driver Tr current. The Pch driver Tr remains on until the coil current reaches the PFM switching current (I_{PFM}). An approximate value for this on-time t_{ON} can be calculated using the following equation:

$$t_{ON} = L \times I_{PFM} / (V_{IN} - V_{OUT})$$

<Maximum on-time function>

To avoid excessive ripple voltage in the event that the coil current does not reach the PFM switching current within a certain interval even though the Pch driver Tr has turned on and the FB voltage is above V_{REF} , the Pch driver Tr can be turned off at any timing using the maximum on-time function of the PFM control circuit. If the Pch driver Tr turns off by the maximum on-time function instead of the current sense circuit, the Nch synchronous rectification switch Tr will not turn on and the coil current will flow to the V_{OUT} pin by means of the parasitic diode of the Nch synchronous rectification switch Tr.

< V_{IN} start mode>

When the V_{IN} voltage rises, V_{IN} start mode stops the short-circuit protection function during the interval until the FB voltage approaches V_{REF} . After the V_{IN} voltage rises and the FB voltage approaches V_{REF} by step-down operation, V_{IN} start mode is released. In order to prevent an excessive rush current while V_{IN} start mode is activated, Nch synchronous rectification switch Tr will not turn on and the coil current flows to the V_{OUT} pin by means of the parasitic diode of the Nch synchronous rectification Tr. In V_{IN} start mode as well, the coil current is limited by the PFM switching current.

<Short-circuit protection function>

The short-circuit protection function monitors the V_{OUT} voltage. In the event that the V_{OUT} pin is accidentally shorted to GND or an excessive load current causes the V_{OUT} voltage to drop below the set short-circuit protection voltage, the short-circuit protection function activates, and turns off and latches the Pch driver Tr at any selected timing. Once in the latched state, the IC is turned off and then restarted from the CE pin, or operation is started by re-applying the V_{IN} voltage.

<UVLO function>

When the V_{IN} pin voltage drops below the UVLO detection voltage, the IC stops switching operation at any selected timing, turns off the Pch driver Tr and Nch synchronous rectification switch Tr (UVLO mode). When the V_{IN} pin voltage recovers and rises above the UVLO release voltage, the IC restarts operation.

< C_L discharge function>

On the XC9272 series, a C_L discharge function is available as an option (XC9272B type). This function enables quick discharging of the C_L load capacitance when “L” voltage is input into the CE pin by the Nch Tr connected between the V_{OUT} -GND pins, or in UVLO mode. This prevents malfunctioning of the application in the event that a charge remains on C_L when the IC is stopped. The discharge time is determined by C_L and the C_L discharge resistance R_{DCHG} , including the Nch Tr (refer to the diagram below). Using this time constant $\tau = C_L \times R_{DCHG}$, the discharge time of the output voltage is calculated by means of the equation below.

$$V = V_{OUT} \times e^{-t/\tau}, \text{ or in terms of } t, t = -\tau \ln(V_{OUT} / V)$$

V: Output voltage after discharge

V_{OUT} : Set output voltage

t: Discharge time

C_L : Value of load capacitance (C_L)

R_{DCHG} : Value of C_L discharge resistance Varies by power supply voltage.

$$\tau : C_L \times R_{DCHG}$$

The C_L discharge function is not available on the XC9272A type.

■ NOTE ON USE

1. Be careful not to exceed the absolute maximum ratings for externally connected components and this IC.
2. The DC/DC converter characteristics greatly depend not only on the characteristics of this IC but also on those of externally connected components, so refer to the specifications of each component and be careful when selecting the components. Be especially careful of the characteristics of the capacitor used for the load capacity C_L and use a capacitor with B characteristics (JIS Standard) or an X7R/X5R (EIA Standard) ceramic capacitor.
3. Use a ground wire of sufficient strength. Ground potential fluctuation caused by the ground current during switching could cause the IC operation to become unstable, so reinforce the area around the GND pin of the IC in particular.
4. Mount the externally connected components in the vicinity of the IC. Also use short, thick wires to reduce the wire impedance.
5. When the voltage difference between V_{IN} and V_{OUT} is small, switching energy increases and there is a possibility that the ripple voltage will be too large. Before use, test fully using the actual device.
6. The CE pin does not have an internal pull-up or pull-down, etc. Apply the prescribed voltage to the CE pin.
7. If other than the inductance and capacitance values listed in the "Typical example" are used, excessive ripple voltage or a drop in efficiency may result.
8. If other than the inductance and capacitance values listed in the "Typical example" are used, a drop of output voltage at load transient may cause the short-circuit protection function to activate. Before use, test fully using the actual device.
9. At high temperature, excessive ripple voltage may occur and cause a drop in output voltage and efficiency. Before using at high temperature, test fully using the actual device
10. At light loads or when IC operation is stopped, leakage current from the Pch driver T_r may cause the output voltage to rise.
11. The average output voltage may vary due to the effects of output voltage ripple caused by the load current. Before use, test fully using the actual device.
12. If V_{IN} voltage is high or the C_L capacitance or load current is large, the output voltage rise time will lengthen when the IC is started, and coil current overlay may occur during the interval until the output voltage reaches the set voltage (refer to the diagram below).

13. When the IC is started, the short-circuit protection function does not operate during the interval until the V_{OUT} voltage reaches a value near the set voltage.
14. If the load current is excessively large when the IC is started, it is possible that the V_{OUT} voltage will not rise to the set voltage. Before use, test fully using the actual device.

■ NOTE ON USE (Continued)

15. In actual operation, the maximum on-time depends on the peripheral components, input voltage, and load current. Before use, test fully using the actual device.
16. When the V_{IN} voltage is turned on and off continuously, excessive rush current may occur while the voltage is on. Before use, test fully using the actual device.
17. When the V_{IN} voltage is high, the Pch driver may change from on to off before the coil current reaches the PFM switching current (I_{PFM}), or before the maximum on-time elapses. Before use, test fully using the actual device.
18. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
19. Torex places an importance on improving our products and their reliability.
We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.

■ NOTE ON USE (Continued)

● Instructions of pattern layouts

1. To suppress fluctuations in the V_{IN} potential, connect a bypass capacitor (C_{IN}) in the shortest path between the V_{IN} pin and ground pin.
2. Please mount each external component as close to the IC as possible.
3. Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
4. Make sure that the ground traces are as thick as possible, as variations in ground potential caused by high ground currents at the time of switching may result in instability of the IC.
5. Internal driver transistors bring on heat because of the transistor current and ON resistance of the driver transistors.

● SOT-25 Power Dissipation (40mm x 40mm Standard board)

Power dissipation data for the SOT-25 is shown in this page.

The value of power dissipation varies with the mount board conditions.

Please use this data as the reference data taken in the following condition.

1. Measurement Condition

Condition: Mount on a board

Ambient: Natural convection

Soldering: Lead (Pb) free

Board: Dimensions 40 x 40 mm

(1600 mm² in one side)

Copper (Cu) traces occupy 50% of the board area in top and back faces

Package heat-sink is tied to the copper traces

(Board of SOT-26 is used.)

Material: Glass Epoxy (FR-4)

Thickness: 1.6mm

Through-hole: 4 x 0.8 Diameter

Evaluation Board (Unit: mm)

2. Power Dissipation vs. Ambient Temperature

Board Mount ($T_J \text{ max} = 125^\circ\text{C}$)

Ambient Temperature ($^\circ\text{C}$)	Power Dissipation P_d (mW)	Thermal Resistance ($^\circ\text{C}/\text{W}$)
25	600	166.67
85	240	

● USP-6EL Power Dissipation (40mm x 40mm Standard board)

Power dissipation data for the USP-6EL is shown in this page.

The value of power dissipation varies with the mount board conditions.

Please use this data as the reference data taken in the following condition.

1. Measurement Condition

Condition : Mount on a board

Ambient : Natural convection

Soldering : Lead (Pb) free

Board : Dimensions 40 x 40 mm

(1600 mm² in one side)

Copper (Cu) traces occupy 50% of the board

area in top and back faces

Package heat-sink is tied to the copper traces

Material : Glass Epoxy (FR-4)

Thickness : 1.6mm

Through-hole : 4 x 0.8 Diameter

Evaluation Board (Unit: mm)

2. Power Dissipation vs. Ambient Temperature

Board Mount (T_j max = 125°C)

Ambient Temperature (°C)	Power Dissipation Pd (mW)	Thermal Resistance (°C/W)
25	1000	100.00
85	400	

MARKING RULE

●SOT-25(Under dot)

●USP-6EL

① represents product series

MARK	PRODUCT SERIES
C	XC9272A/B*****-G

② represents output voltage

MARK	OUTPUT VOLTAGE		PRODUCT SERIES
N	0.6	0.65	XC9272*06***-G
P	0.7	0.75	XC9272*07***-G
R	0.8	0.85	XC9272*08***-G
S	0.9	0.95	XC9272*09***-G

③ represents product type and output voltage type

MARK	PRODUCT TYPE	OUTPUT VOLTAGE TYPE	PRODUCT SERIES
N	Without C _L Discharge	Output Voltage {x.x0V} (the 2nd decimal place is "0")	XC9272A**1**-G
P	Without C _L Discharge	Output Voltage {x.x5V} (the 2nd decimal place is "5")	XC9272A**B**-G
R	With C _L Discharge	Output Voltage {x.x0V} (the 2nd decimal place is "0")	XC9272B**1**-G
S	With C _L Discharge	Output Voltage {x.x5V} (the 2nd decimal place is "5")	XC9272B**B**-G

④⑤ represents production lot number

01~09, 0A~0Z, 11~9Z, A1~A9, AA~AZ, B1~ZZ

(G, I, J, O, Q, W excluded)

* No character inversion used.

1. The product and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.
2. The information in this datasheet is intended to illustrate the operation and characteristics of our products. We neither make warranties or representations with respect to the accuracy or completeness of the information contained in this datasheet nor grant any license to any intellectual property rights of ours or any third party concerning with the information in this datasheet.
3. Applicable export control laws and regulations should be complied and the procedures required by such laws and regulations should also be followed, when the product or any information contained in this datasheet is exported.
4. The product is neither intended nor warranted for use in equipment of systems which require extremely high levels of quality and/or reliability and/or a malfunction or failure which may cause loss of human life, bodily injury, serious property damage including but not limited to devices or equipment used in 1) nuclear facilities, 2) aerospace industry, 3) medical facilities, 4) automobile industry and other transportation industry and 5) safety devices and safety equipment to control combustions and explosions. Do not use the product for the above use unless agreed by us in writing in advance.
5. Although we make continuous efforts to improve the quality and reliability of our products; nevertheless Semiconductors are likely to fail with a certain probability. So in order to prevent personal injury and/or property damage resulting from such failure, customers are required to incorporate adequate safety measures in their designs, such as system fail safes, redundancy and fire prevention features.
6. Our products are not designed to be Radiation-resistant.
7. Please use the product listed in this datasheet within the specified ranges.
8. We assume no responsibility for damage or loss due to abnormal use.
9. All rights reserved. No part of this datasheet may be copied or reproduced unless agreed by Torex Semiconductor Ltd in writing in advance.
